Car-Net via WLAN
Internet connection via WLAN to access the Car-Net services
Dear driver.

This leaflet explains what you need to do to connect your infotainment system to the internet via a WLAN (wireless local area network) connection so you can use Car-Net services inside your Volkswagen. However, this information does not describe all functions, and therefore cannot replace the owner’s manual accompanying the vehicle which contains additional important explanations and warning instructions.

Car-Net: in brief

Car-Net is an optionally available package of online services designed to offer enhanced safety and convenience behind the wheel. With information constantly synced with the internet, finding a parking spot and avoiding jams is easier than ever. Different Car-Net services may be offered in different countries to specific conditions and the range may also vary from one model to the next.

To find out more about Car-Net, go to http://volkswagen-carnet.com/en/start.html or contact your nearest Volkswagen dealer. For information on mobile phone network charges and conditions contact your network provider.
Your vehicle’s infotainment system has to be online before you can use Car-Net. The various ways to do this are shown here.

**Internet connection options.**

* rSAP is a Bluetooth profile. It has to be supported by your phone.

** Internet connection via WLAN only works if none of the other methods mentioned above are being used at the same time.

---

**Internet access via WLAN.**

With this method, the internet connection is provided not by the infotainment system itself but, for example, by a WLAN hotspot linked to your mobile phone. Your phone in this case functions as a modem and the infotainment system is the “client”. **
Step by step: Your infotainment system as a WLAN client

1. Switch on your mobile device (e.g. smartphone) and activate it as a “WLAN hotspot” (usually via e.g. → main menu → Settings → Wireless connections) ***

2. Switch on hotspot visibility on the device. The hotspot name and network code are now shown.

3. Next, go to the main menu of your infotainment system and open → Setup → WLAN → WLAN settings.

   Activate WLAN in the menu shown and start the hotspot search.

   Select your mobile device.

4. Please enter the network code.

   The hotspot is now connected (as shown by the tick). In future, this process will happen automatically when the hotspot is within range and switched on.

   To delete the hotspot link, press the waste bin symbol.

You can now access Car-Net services from your infotainment system by going to the appropriate menu.

***Please note that on some devices the WLAN hotspot may switch off after a certain period, and will have to be reactivated.
